Fall-Direction Classification

27 simple
features

machine learning

BDM, LSM, k -NN,
ANN, SVM, DTC, RF,
AdaBoost classifiers

fall direction

forward

backward

right

left

undefined

RESULTS

- ◆ Conducted robustness analysis that includes falls with undefined directions, not in the training set.
- ◆ Above 96% fall-direction classification accuracy is achieved.
- ◆ Classification can be performed in near-real time (<5 ms).
